XII. Exposure to Biohazardous Material - Emergency Guide

I. General Facility Information
The FACSAria Fusion instrument is located in the OUHSC Core Laboratory on the 1st floor, Room 1102 of the Biomedical Research Center with the main office located on the 1st floor, Room 1106. Regular business hours are between 8:00 AM to 5:00 PM Monday through Friday. Facility doors are locked at all times and users will be given access to the lab by the Fusion operator or the secretary in Room 1106 by permission and with appointment only. The laboratory is approved at Biosafety Level 2 (BSL-2) and is maintained under negative pressure at all times. Laboratory door is always closed and gloves are to be worn when handling samples or for processing on the Fusion. Goggles or safety glasses, gloves, and disposable lab coats are also required for operating the Fusion cell sorter. Disposable lab coats will be made available for all users for a nominal fee. The operator is required to wear a disposable lab coat (frontal enclosed with elastic cuff) that must be disposed of before leaving the laboratory. The area around the sorter will be blocked off and signage in place during the sort to limit the access of instrumentation to only the operator and user.

II. Facility Orientation and Training
Facility staff provides training and orientation for all instrumentation. New users are required to take a one-on-one, hands-on training for the relevant instrumentation. Exposure procedures and emergency response are discussed with our users during training. Exemption from hands-on instrument training is given to users who are only signing up for assisted appointments but lab personnel will still go over safety guidelines and will provide each user with a copy of this document. In addition, all SOPs will be made available on our laboratory website (http://research.ouhsc.edu/core-facilities/flow-cytometry-and-imaging-2/standard-operating-procedures/) so that they can be easily accessed at any time.

III. Approval to Sort
Sort appointment requests must be confirmed by staff on an individual basis. On request forms,
PI's must provide information regarding their biosafety protocols and disclose any relevant information regarding individual samples prior to delivery of samples for cell sorting. All users are required to submit the online (iLabs) "Cell analysis questionnaire for use of the Fusion cell sorter in the flow cytometry and imaging core facility" prior to their appointments. This intake form must be submitted a minimum of 4hrs prior to their scheduled sorting appointment.

IV. Pre-Sort Procedures
Individual sorting requests are confirmed by staff prior to appointments, after confirming that all required information has been provided by user and that the information is up to date. Users will receive a confirmation email from the Core Facility Manager if approval is granted. Sort requests without proper information or with any conflicting information will be denied. Users will receive an e-mail about the denied requests and follow-up discussion may be initiated by laboratory staff or user. Only approved sort samples can be delivered to the facility for procedures. Sample transportation must strictly follow procedures outlined in the user's biosafety protocol for the appropriate BSL level. Samples must be completely processed, stained, and ready-to-acquire prior to sort procedure. Staining procedures, which do not require washing steps (i.e. live/dead stain) may be completed at the flow facility in the biosafety cabinet.

NOTE: All samples must be filtered prior to sorting in order to reduce possibility of clogging the instrument. Samples need to be capped or covered with paraffin before vortexing to minimize aerosols (placing glove over tube is not acceptable).

Flow staff performs the following standard procedure prior to cell sorting on the Fusion:
• Ensure that sheath tank has enough fluid for the day (0.5L/hour)
• Turn on main power switch (right side)
• Turn on computer
• Turn on air compressor (right side)
• Turn on Biosafety Cabinet and AMS to low setting 15 minutes before sort
• Turn on 4°C water bath if needed
• Perform fluidics start-up and aseptic cleaning when sterile sort conditions are required.
• Stabilize stream and run daily quality control experiment.
• Stabilize side streams, test sort performance, set drop-delay and aim sort streams.

Prior to aseptic sorts, surfaces of the sample injection chamber and of the collection chamber are sterilized with 70% ethanol. Sterile PBS is run through the flow cytometer prior to placing sterile sample on the sorter.

V. Post-Procedures
After sorting of any material, 10% bleach is run through the cytometer for 5 minutes followed by 5 minutes of dH2O. The sample injection chamber, collection chamber and the collection device are surface decontaminated with 70% ETOH with a contact time of 5 minutes (University of Wisconsin, Madison, n.d.). Computer bench is wiped off with 70% ethanol. The waste tank (containing minimum 10% volume of household bleach) is emptied into sink. The
sink is then rinsed with running water for 1 minute. Stream is shut off, lasers are powered off and appropriate fluidics shut-off procedures are followed. Instrument and computer are turned off. Waste from live samples is decontaminated according to decontamination procedures outlined in the biosafety protocol (see inserted table). All users and staff are required to remove and dispose of any PPE prior to leaving the laboratory. Waste that is deposited in biohazard bags (tubes, tips, other consumables) is autoclaved prior to disposal. All users and staff wash and sanitize hands before leaving the laboratory.

VI. Unexpected Stream Shutoff During Sort Procedure
Clogging and air bubbles may suddenly disintegrate the stream and may result in the deflection of sort streams, spills in the sort collection chamber and significant vapor and aerosol generation. In order to recover the sort stream and re-set, the sort stream needs to be turned off and aerosols need to be evacuated the BioSafety Cabinet (BSC) flow must be allowed to run for a minimum of two minutes to clear any aerosols before proceeding to decontamination of the inside of the cabinet. Specifically, the sash and all inside surfaces must be decontaminated using 70% ETOH. The sorting chamber of the Fusion also needs to be decontaminated before proceeding. Flooding the collection chamber surface with 70% ETOH bleach for 5 minutes does this (University of Wisconsin, Madison, n.d.). Once this decontamination procedure is complete, a new sort can be initiated.

** Note autoclaving time will be extended to 1-hour do to recent changes in OUHSC autoclaving policies **

VII. Spill Procedures
Spill management is done following procedures outlined in our biosafety protocol (see tables below). Spills inside flow cytometers and on the flow cytometer bench are treated as Spills
Outside Containment. Flow cytometer surfaces are wiped with 70% ETOH, left on surface for 5 minutes. Large spills on flow cytometer surfaces and inside the sort chamber or on other lab surfaces are cleaned with 70% ETOH left on surface for 20 minutes with a soaked, wet towel. No spray bottles are allowed when cleaning a spill of any material associated with aerosol hazard. We require all users to follow guidelines in our spill protocol when working at our facility. Spill kits are provided in the laboratory. PPE is properly disposed of in biohazard containers after cleaning of a spill.

### VIII. Waste Management

If emptying waste tank, add 0.5L household bleach to the new waste tank. Waste content is pored down the sink and rinsed for 1 minute as a standard facility procedure.
Liquid waste in sample tubes smaller than 1 ml total volume can be re-capped and disposed of in the biohazard bags for autoclaving. Any larger volumes of liquid waste need to be treated with 10% bleach for 30 minutes prior to disposal down the sink followed by a 1 minute rinse. Solid waste is disposed in biohazard bags and autoclaved as described in the Decontamination Table on Page 4. Solid decontaminated waste can be disposed of in core facility biosafety hazard bags for autoclaving only if proper procedures outlined in this SOP are followed. All the hazardous waste generated during sample preparation must be collected inside the biosafety cabinet into a labeled waste container.

**IX. Aerosol Management System**
The Aerosol Management System installed on the FACSaria Fusion cell sorter is connected directly to the biosafety cabinet and is designed to reduce risk for exposure during cell sorting. A vacuum source creates negative pressure around the sort chamber and evacuates aerosols generated by the sort stream. The BSC is certified on a yearly basis, but needs to be monitored for daily performance of cabinet pressure (inches of water ≥0.45 and ≤ 0.65) and the AMS flow rate (14 +/- 0.5 CFM on Low and High > 20 CFM). Glow germ testing was also performed to determine baseline levels after instrument install. These tests showed complete aerosol containment based on standards recommended in the 2014 ISAC Cytometry Cell Sorter Biosafety Standards document. Testing will be done at a minimum after any service of the Fusion cell sorter or safety cabinet. In addition, monthly testing will be performed by laboratory personnel using an Air-O-Cell air-monitoring cassette (Lopez, 2011).

**X. Operator Training and Experience**
Core facility personnel are the only individuals allowed to perform sorts using the Fusion. Core facility users are not allowed to operate the Fusion cell sorter but will be provided with copies of the SOP and instrument protocols at the initial training. Copies are also available in the laboratory and online on our core lab website. (http://research.ouhsc.edu/core-facilities/flow-cytometry-and-imaging-2/standard-operating-procedures/) Training for the user on this instrument includes basic instrument operation and all relevant safety procedures, spill management, and decontamination so that they understand what the operator is doing while running their samples.

**XI. Exposure to Biohazardous Material**
All employees with occupational exposure should receive Bloodborne Pathogens training at the time of assignment to tasks where occupational exposure may take place, when changes affect employees' occupational exposure and at least annually thereafter. The hepatitis B vaccine should be made available to all employees who have occupational exposure to blood or other potentially infectious materials. These employees should also take the online Bloodborne Pathogens training course annually (found on the EHSO website). If an employee sustains an exposure incident (such as a stick with a contaminated needle/scalpel/dental wire or a splash of potentially infectious material in the eye, mouth, mucous membrane, or non-intact skin), the exposed person should immediately:

a. clean the wound with soap; flush mucous membranes with water or normal saline solution;
b. notify his/her supervisor, designated coordinator, or other designated individual;

c. proceed for treatment within 1-2 hours of the exposure (see the OUHSC/OU-Tulsa Infectious Diseases Policy for current recommended treatment locations); and

d. if possible, for laboratory exposures, bring a sample of the source material to the treatment facility for testing.

Sources:

The following facilities are recommended for treatment of occupational injuries or exposures, however employees may choose any health care professional they wish.

Employee Health
OU Physicians Building Suite 2C
825 NE 10th
Oklahoma City, OK
271-9675 (271-WORK)
